

Sales Analysis Report using PowerBi

This is prepared using visualization tool called PowerBi to calculate or analyse the sales data.

- The first chart represents the sum of sales based on segment and to visualize it I have used donut chart.
- In order to represent order date we have to always use line chart so I ended up using line chart to represent sales by order date.
- The numerical part represents whole sum of the quantity, discount, sales, profit.
- I used to represent sum of sales by category for easy understanding purpose even if the employee was from non-tech he can easily get to understand the data by using bar chart visualization.

- I used to represent the map to visualizalize the state with the regarding of the data sales.

Atlast,I ended up using the sum of the sales occurred based on that region(sum of sales by region) to visualize in pie chart.

This is dummy background canvas I have used we can use any bg to copy and paste to look good while preparing the report.I made this in powerpoint and greated a shapes like containers and pasted the data got from powerbi.
